

Cleanup Styles

This plugin is a bit similar to [Blueprint Maker](#) but has a more special use case and a lot of options! It is useful for adjusting the stroke width and opacity of large groups. Usually for good laser cutting the line width has to match a maximum width to be recognized as a **hairline**. Additionally, often opacity issues cause that lines are missed by laser cutter.

Conversion information

- 1 pt = 0,352 mm = 0,0138889 in
- 0,0283 pt = 0,01 mm

Handling of dedicated style attributes

Catch dedicated, but prefer composed (master) style ▼
