

# Security

## General Tips

- run Teedy in Intranet
- use SSL
- adjust apache2 to hide /api/app information (json output which contains information like used version, user count, etc.)

```
<Location "/api/app">
    AllowOverride None
    Order deny,allow
    Deny from All
</Location>

<Location ~ "/api/app/.*">
    AllowOverride None
    Allow from All
</Location>

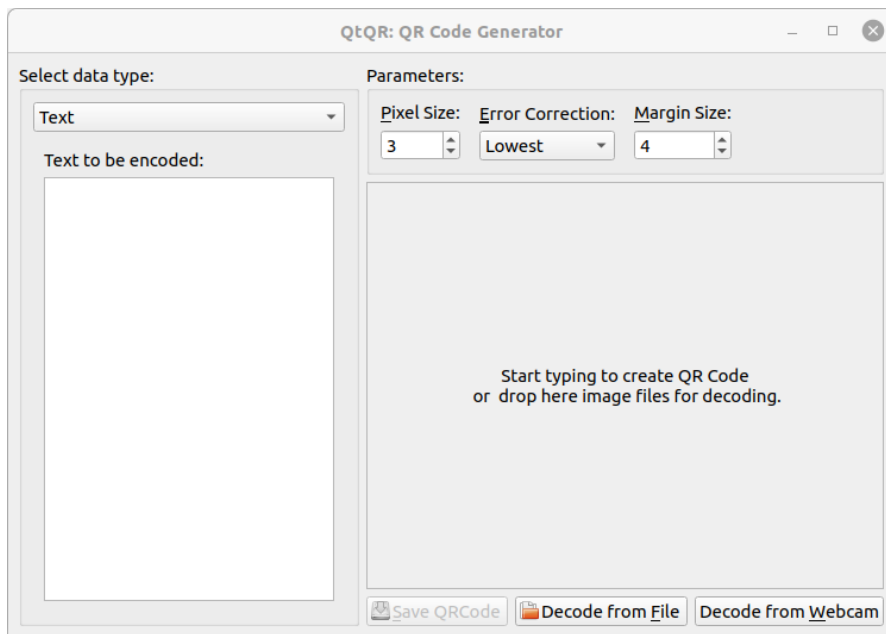

#rewrite /api/app/ to /api/app and so on. Otherwise api/app will be blocked but api/app/ will
not be blocked
RewriteEngine on
RewriteCond %{REQUEST_FILENAME} !-d
RewriteRule ^(.*)/$ /$1 [R=301,L]
```

- enable 2FA for each user account
- Change admin user name to something else

```
UPDATE t_user SET use_username_c = 'yournewusername' WHERE use_username_c = 'admin';
```

On Linux you can use <https://wiki.ubuntuusers.de/QtQR> to import a QR code image from Desktop in case you just want to generate TOTP tokens with tools like [KeePassXC](#) for instance. Just run qtqr and select "Decode from File" to open such QR code.

```
apt install qtqr
qtqr #run the app
```
